Serverless

Page No:
Date.

→ Serverless doesn't means no running servers

It means you don't manage them

→ Just deploy code/function

→ Initially serverless == Faas [Function as a service]

→ Combined with Autoscaling feature

Serverless service in AWS:-

→ Lamda
→ DynamoDB
→ AWS Cognito
→ AWS API Gateway
→ Fargate
→ S3
→ SNS
→ SQS
→ Kinesis Data base
→ Step Function
→ Aurora serverless

- Athena
- Amazon Quicksight

very very Powerful

EC2 [ ] vs Lamda [λ]

- Virtual servers on cloud
- Limited by RAM & CPU
- Continously running
- Scaling mean intervention to add/remove servers.

- Virtual function
- no server to manage
- Limited by time-short execution
  - Max 15 minutes
- Run on demand
- Scaling is automated

- Pricing is way less.
- Integrated with so many AWS service
- Integrated with many programming language
- Easy monitor through cloudwatch

- Can increase RAM upto 10 GB which automatically improve CPU & network simultaneously

- Used for cloud cost optimization & Cron Jobs.
- Data processing automated like resize image

- Pay-as-you Go in Business
ie
- Run instance only when order is placed & added to respective database
- saves costs.

AWS Lambda -> Limits

ie when it can't be used?

↳ Exam ask Questions like we need 30 GB ram
